

SPEAKER INTRODUCTION

Today we are delighted to have the authors of The Enigma Series discuss the basis of computers and security, which started with the enigma encryption machine, in WWII. This is not only the foundation of the series but the springboard into the moral structure of the R-Group founded by members who escaped Poland into Switzerland.

This is not a boring history lesson on WWII, but rather a way to explain how technology began and how necessary it is to everyday living in our connected world. The family-owned R-Group provides individuals, businesses, and world government agencies with state-of-the-art technology insights and analytics. This team brings readers behind the scenes of how much technology can help or hurt people today.

Our guests will help you decide how much technology may be enough in our daily lives while weaving in the human characters that make you want to read and listen to these stories. Let's put our hands together and welcome Breakfield and Burkey to share their insights into the newest story in the series, though I know they will field any of your questions.
